INFORMS Seattle: Probability Elicitation

VG 1

New NASA Strategic Environment

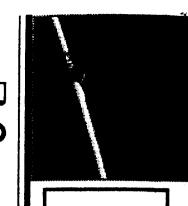

- □ F-B-C: Faster, Better, Cheaper.
- No more "Flagship" projects.
- Many launches a year.
- Implementation time: 18 months.
- ☐ LCA: Life-Cycle Cost Analysis.
- Cost before commitment.
- Proposal development: One week.
- ☐ ISE: Intelligent Synthesis Environment.
- Model-based design.
- Petaflop (10¹⁵) computing capability.

Intelligent Synthesis Environment

- □ Need end-to-end product life-cycle simulation.
- Reduce uncertainty.
- Use geographically distributed talent.
- Capture design knowledge early in life-cycle.
- Convert data into knowledge.
- Fact: Large percentage of cost committed with only small percentage of knowledge
- ☐ Problem: How to close gap between design knowledge and cost commitment.

ISE Major Components

J Components.

- 1. Dynamical interface between humans and computers.
- » CAVE, Vision, Dome.
- » Entertainment industry far in lead
- » Rapid transition from data to intelligence.
- 2. Infrastructure for distributed collaboration between diverse teams across world.
- 3. Tools for rapid synthesis and simulation tools
- 4. Tools to link complete life-cycle simulation in a virtual collaborative environment.
- ☐ Hardware requirements.
- Petaflop (10¹⁵) computing.
- High-Speed Information Corridors.

☐ Cultural barrier.

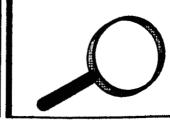

Ref: Dan Goldin, "Tools of the Future," NASA, Washington, DC, 31 January 1998.

INFORMS Seattle: Probability Elicitation

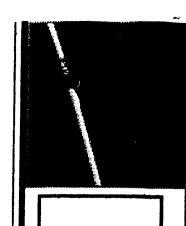

VG4

F-B-C Design Requirements

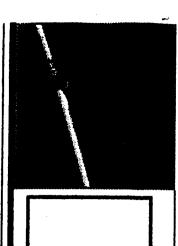

- ☐ Model-Based designs.
- Experts provide models which are compounded up to mission level.
- » Design and analysis done in real-time.
- Requires explicit incorporation of uncertainty.
- ☐ F-B-C does not permit "Worst-case designs."
- Risk cannot be designed out of missions.
- ☐ Rapid development cycle.
- Requires extensive expert judgment.
- » Minimize analysis, test time and cost.
- ☐ Will require extensive probability elicitation.
- For all uncertainties.
- » Randomness of nature (Aleatory or IAEA Type A).
- » Specification error (Model uncertainty or IAEA Type B).
- » Completeness (Unknown unknowns).

JPL Experience in Probability Elicitation

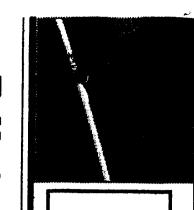

- ☐ Flagship projects with Environmental Impact Statements.
- Voyager to Outer Planets (1977).
- Galileo to Jupiter (1989).
- Ulysses to Jupiter and over the sun (1991).
- Cassini to Saturn (1997).
- » Launch: October 1997.
- » Earth flyby: August 1999,
 » Saturn arrival: 2005.
- » Saturn arrival: 2005.
- I Faster-Better-Cheaper Projects.
- Mars Pathfinder (July 4, 1997 landing).
- Stardust Project.
- » Launch: 1999.
- Comet Wild 2: 2004.
- » Earth return: 2006.

Two F-B-C Missions.

- ☐ Mars Pathfinder.
- Landed "Sojourner Truth" Rover on Mars July 4, 1997.
- Risk assessment done to assess feasibility of design.
- » Entry, descent, and landing of Lander.
- ☐ Stardust Project.
- Launch in 1999.
- Encounter Comet Wild-2 in 2004.
- Flyby of Earth in 2006.
- Release science capsule to land in Utah desert.
- Risk assessment done to assess feasibility of design.

JPL Implementation of SRI Phases of Elicitation

- □ Motivating.
- Purpose.
- Training.
- ☐ Structuring.
- Done by System Engineer.
- Conditioning.Discussion.
- Training.
- ☐ Encoding.
- Odds and reference events for extremes, equally likely for median.
- ☐ Verifying.
- Examine and discuss resulting CDF.

INFORMS Seattle: Probability Elicitation

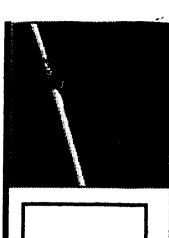

VG8

Quality of Probability Elicitation

- ☐ Requisite Model.
- Everything in the model needed for decisions.
- Nothing in the model not needed for decisions.
- ☐ Substantive Goodness in elicitation.
- Provided by the technology expert.
- □ Normative Goodness in elicitation.
- Provided by the elicitor.
- Training for the technology expert.

Requisite Models.

- ☐ Three step process.
- 1. Project system engineer and risk assessor jointly developed Fault-Tree Model
- 2. Probability elicitation done with engineers cognizant for each critical event.
- 3. Results "rationalized" by project engineer.
- ☐ Final result is expert opinion of project engineer.
- ☐ Fault-Tree modeled in MS Excel.
- ☐ Uncertainties in failure of critical events.
- Modeled as lognormal distributions.
- CDF's of probabilities of failure
- ☐ Monte-Carlo simulation for mission CDF.

Training Session.

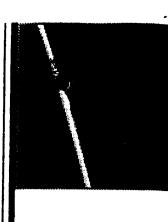

- ☐ Not used for Mars Pathfinder EDL.
- Problems resulted in confusing process with elicitation.
- ☐ Subsequently developed for Stardust Mission.
- ☐ Used Closing Dow Industrial 30 for same day.
- Forty-five minute training session.
- ☐ Knowledge base.
- Knowledge of market.
- 90 days previous data.
- ☐ Training session well received.

Dow 30 Industrials Stock Index

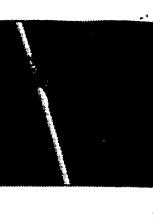

- ☐ Consider the Dow 30 Industrials Stock Index as an example of probability assessment.
- ☐ Given the data you are presented with and your prior knowledge, assess where the Dow will be at the end of the day.
- What are factors that could cause the Dow to be very low?
- What are factors that could cause the Dow to be very high?

1% Assessment of Dow

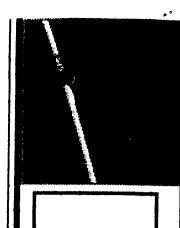

- ☐ This is called a "Bear Market."
- ☐ This is your most pessimistic assessment. It would uncertainties were resolved unfavorably. be the value of the Dow if nearly all of the
- This 1% assessment corresponds to Dow values than your prediction only twice a year. for which the end-of-day values would be lower
- ☐ For what value do you believe the Dow has only one chance in 100 of being lower at the end of the day?
- Probability (1%) =

- ☐ For what probability do you believe the Dow has day? only x% chance of being lower at the end of the
- Probability (1%) =
- Probability (10%) =
- Probability (50%) =
- Probability (90%) =
- Probability (99%) =

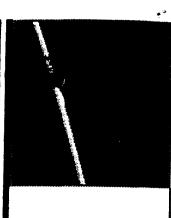

Sources of Knowledge for F-B-C Missions

- □ Taxonomy for sources of F-B-C NASA space knowledge
- Flight experience.
- Testing.
- Analysis.
- Expert judgment.
- Almost all knowledge is a combination of these sources
- ☐ Expert judgment always present.

INFORMS Seattle: Probability Elicitation

VG 15

Thinking About Failures

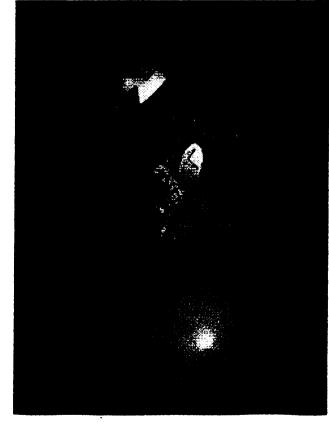

- Three perspectives on failure probabilities.
- 1. Think about design, implementation, and operations of similar complexity. How often would this result in failure?
- 2. Repeat the design, implementation, and operation for your event many times. How often would this result in failure?
- 3. Think of failure events in your life for which statistical evidence exists. Is the failure of your event more or less probable?

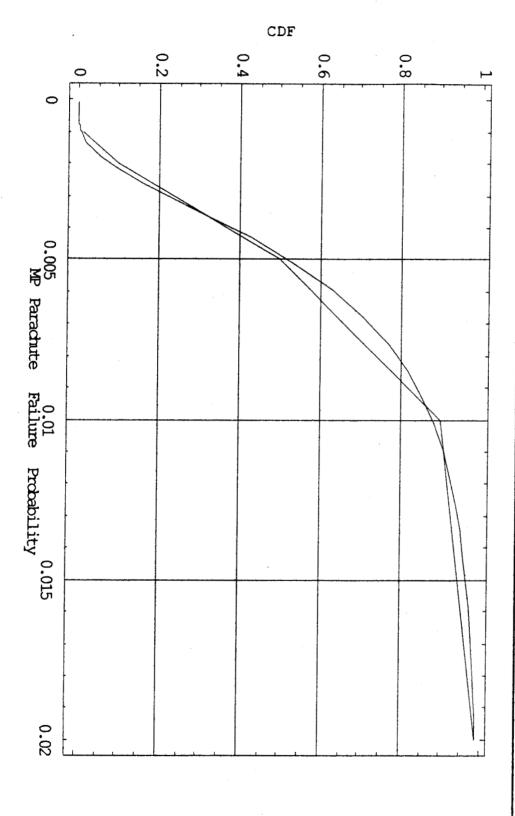

Typical Elicitation VG

- ☐ This is your most optimistic assessment. It would uncertainties were resolved favorably. be the failure probability if nearly all of the
- ☐ For what probability do you believe the "true value," if it could be known, has only one chance in 100 of being lower?
- Probability (1%) =

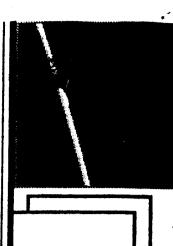

INFORMS Seattle: Probability Elicitation

VG 18

Mars Pathfinder Entry, Descent and Landing

- Eight month cruise from Earth to Mars.
- Separate Lander from Cruise Stage (T 35 min). min). Atmospheric entry with ablative heat-shield (T - 5
- Parachute deploy and heat-shield separation (T 2 min).
- Radar locks on Mars Surface (T 25 sec).
- ☐ Airbags deploy (T 5 sec).
- ☐ Retro-rockets fire (T 3 sec).
- Free-fall from 15 meters (T 1 sec).
- Bounce on surface and roll to stop (1 km).
- Deflate airbags and petal deployment (T + 3 hours).

Risk Assessment Mars Pathfinder

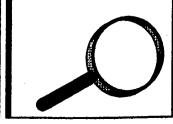

- Entry-Descent-Landing risk assessment.
- All events in series--no redundancy.
- Mission modeled as series elements in MS Excel.
- Monte-Carlo simulation in @RISK.
- Cognizant engineers for each failure event interviewed.
- No training session for probability elicitation.
- ☐ Two Deputy Project Engineers independently assessed probability of failure at mission level.
- Results presented at launch-readiness review.
- PRA done too late in development to influence design.
- □ Did alert Project to areas needing extensive testing.

INFORMS Seattle: Probability Elicitation

Mars Pathfinder PDF

Stardust Spacecraft

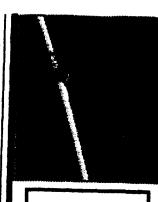

Stardust Risk Assessment

- Assessment from Launch Vehicle Separation to
- recovery of Science Capsule in Utah desert.
- All events in series---no redundancy modeled.
- Mission Modeled as series elements in MS Excel.
- Monte-Carlo simulation in JPL Excel Add-In.
- Probabilities elicited from cognizant engineers Training sessions for all probability assessors.
- Project engineer reassessed probability of failure at mission level.
- Results not formally presented by Project.
- PRA done too late in development to influence design.
- ☐ Design conservatism obscured true risk.

INFORMS Seattle: Probability Elicitation

Prototype Stardust Mission PDF

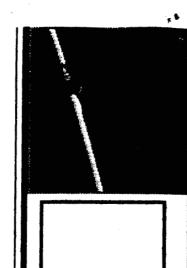

MBA* Criteria

- 1. Experts are poor processors of information.
- 2. Effective techniques for reducing overconfidence.
- 3. Decompose the problem.
- 4. Aggregate multiple experts.
- 5. Use structured group processes.
- 6. Combine expert judgments using math methods.
- A. Mosleh, Vicki M. Bier, and G. Apostolakis, Methods for the Elicitation 0533, Pickard, Lowe and Garrick, Inc., Prepared for the U.S. Nuclear and Use of Expert Opinion in Risk Assessment: Phase 1 -- A Critical **Regulatory Commission, August 1987.** Evaluation and Directions for Future Research, NUREG/CR-4962 and PLG-

Critique of Process

- Done too late to influence design.
- Management and engineering biases present.
- ☐ Engineers don't understand statistical processes.
- ☐ Reluctance to accept subjective probabilities.
- ☐ Reluctance to accept PRA in general.

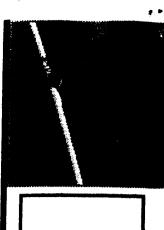

For Future Research

- New methodology and new culture needed for control of biases
- Is a probability of a probability a probability? *
- l Display PDF to expert.
- CDF yields little feedback.
- Fitting standard PDF to elicited CDF yields some feedback.
- Need differentiable CDF.
- » With strong monotonicity for unimodal PDF.
- ☐ Relation between knowledge and PDF.
- Perhaps information theory has something to contribute.
- Brian Skyrms, "Higher Order Degrees of Belief," in Prospects for Pragmatism, Essays In Honor of F. P. Ramsey, D. H. Mellor (Ed.), Cambridge University Press, Cambridge, pp. 109-137, 1980.
